## \* license

MIT License  
no warranty  
see LICENSE.txt

## \* requirements

all platforms	serialosc, python (not included) pymonome, pyperclip, pyOSC, pybonjour (included)
linux	xdotool (not included)

## 0. start

open a terminal or command prompt window

change to the dune farm directory  
example: `cd Downloads/dunefarm`

say this

`python dunefarm.py`

if 'python' is not recognized on windows, see page 4, "notes"

## i. turn

rotate your monome so the cord is at the top:

## ii. look

you can fill your monome with several dunes of text.

this is what all the buttons do. we'll look at each function one by one.

## iii. make a dune

first, find a bunch of text somewhere. select it with your mouse.

press PUT to put it on the monome:

each button in the dune is one word from the text.

press a button to output that word.

this is the same as pressing paste on your computer, or ctrl+v.

so, if you open a text editing program, then press a button, the word will show up there.

press a few words in the dune to start making a poem.

#### iv. jump the dune

if you put a very long text on your monome, it will make a very big dune.

but! your monome can only show a limited number of words at once:

64: 54 words  
128: 118 words  
256: 238 words

so, press JUMP to jump to a random part in the dune.

for example, in a dune 1000 words long:

1) words 1 - 118 shown

2) JUMP

3) words 542 - 659 shown

#### v. undo and enter

so you can make poems without reaching for your keyboard.

undo is the same as pressing ctrl+z

enter is the same as pressing enter

UNDO

ENTER

#### iv. choose a dune

64s and 128s have six dunes

256s have fourteen

choose between dunes on the bottom row.

#### iv. pour dunes

you can pour one dune into another.

hold down one dune selector, then press a different one.

this only pours words currently shown, not the entire dune.  
(a good way to save a good part from a big dune)

words pour onto the top of the receiving dune

DUNE  
SELECTORS

## vi. fancy pants

hold...

JUMP + put	:	mix up all words in dune
JUMP + undo	:	remove/restore punctuation*
JUMP + enter	:	output all words shown

\*also returns you to the start of the dune

## vii. brightness

while dune farm runs, the terminal says go!

you can type

b 0	:	to set brightness (0 min, 15 max)
-----	---	-----------------------------------

change the default brightness by changing "brightness" in duneFarm.py  
(it's easy. you can use any plaintext editor.)

## viii. notes

\* don't press PUT or UNDO when the terminal/command prompt window is selected.  
the program may exit, or do something else weird

\* windows: if you get the error '*python*' is not recognized, see  
<http://people.cis.ksu.edu/~schmidt/200f07/setpath.html>  
(xp instructions)

## ix. quit

ctrl+c

\* \* \*

there's a reference sheet on the next page

# dune farm

reference

hold down two dune selector buttons to pour one dune onto another  
press:

PUT	to	make a dune
JUMP	:	jump to a random part
JUMP + put	:	mix up all words in dune
JUMP + undo	:	remove/restore punctuation
JUMP + enter	:	output all words shown

at the terminal, type

b 0	:	set brightness (0 min, 15 max)
help	:	show a copy of this reference page
ctrl+c	:	quit
